The most effective filter against light pollution by street lights:

I was reading quite some articles about the most effective filters against light polluted skies. Here is what turned out to be most effective in my neighbourhood.

I just took a sheet of aluminium foil, opened the street lamp and shaded the window pane which is heading in the direction of my premise / observing location. The light which is no more disturbing me is not lost but reflected to the street opposite to my garden. I guess this is the least expensive and most effective filter you can imagine ;-)

Kind regards

Matthias
