

A 3D printed encasing for the NanoVNA V2

Matthias, DD1US, June 24th 2020, rev 1.0

Looking for an encasing for my NanoVNA V2 I found a nice design on Thingiverse. It is printed from plastics and thus does not provide any shielding but as the critical parts of the PCB are shielded with tin-plated covers this should not be a problem. Here is the link to the design data:

<https://www.thingiverse.com/thing:4285813>

A friend printed the encasing for me and it fits really well:

In the pictures you can also see the “Connector Savers” which are SMAm-SMAf adapters which protect the original SMA jacks of the NanoVNA V2. Once they are worn out, they can be simply replaced.

I also replaced the original foil on the screen which you can see on the pictures with a stronger screen protector foils as it is widely used for cellphones.

Questions and remarks are always welcome. Please send them to my Email address give below.

Kind regards
